

Software Engineering Tools Lab

Assignment No-1

(Module 1- Introduction to OSS)

Name: Rohit Padmakar Biradar

Batch: T7

PRN: 2019BTECS00061

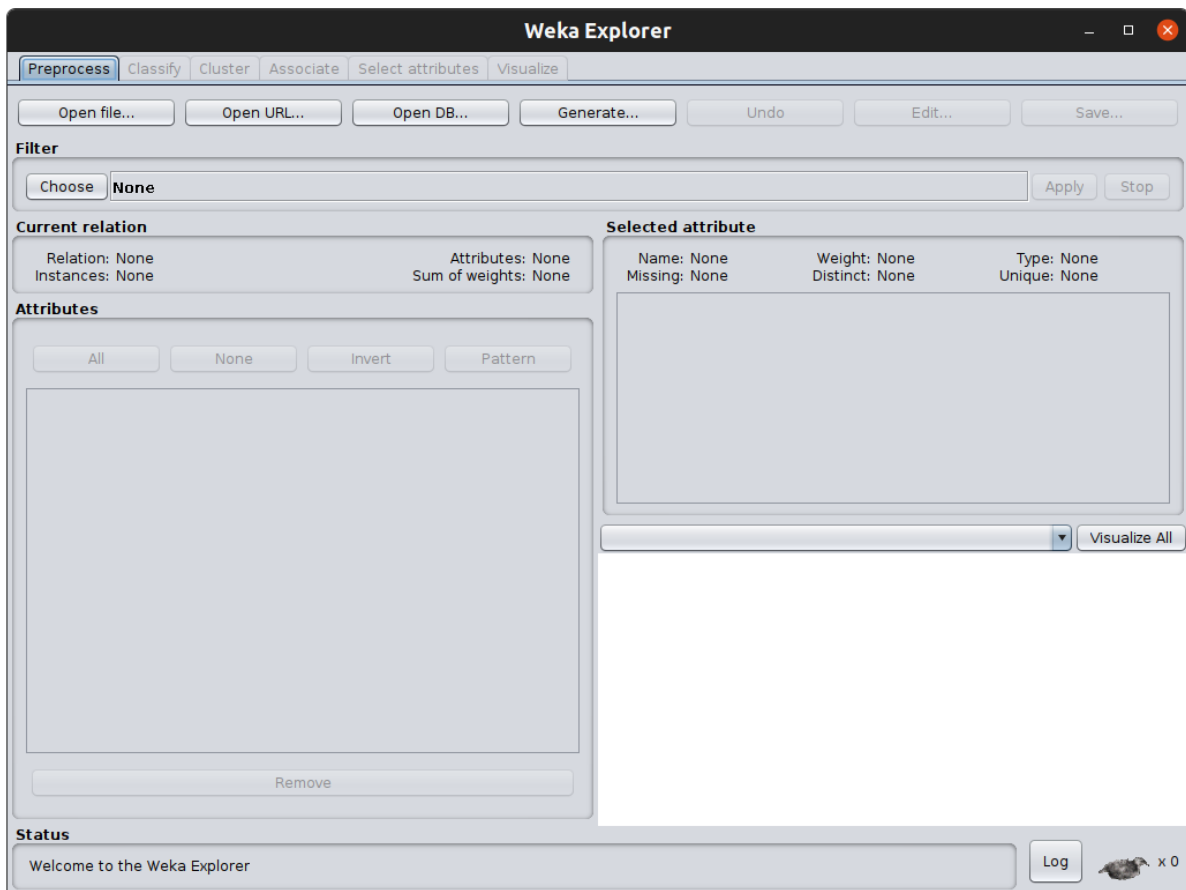

1. **Weka** is a GUI workbench that empowers data wranglers to assemble machine learning pipelines, train models, and run predictions without having to write code. Using Weka tool perform below tasks such as data preprocessing, data classification (use any appropriate ML algorithm) and data visualisation efficiently on a given dataset.

Use the Iris dataset given

<https://drive.google.com/file/d/1A3Fxsfzm6BSfhFZGDrjI47RTe45bSgYP/view>

Note-provide screenshots for every task

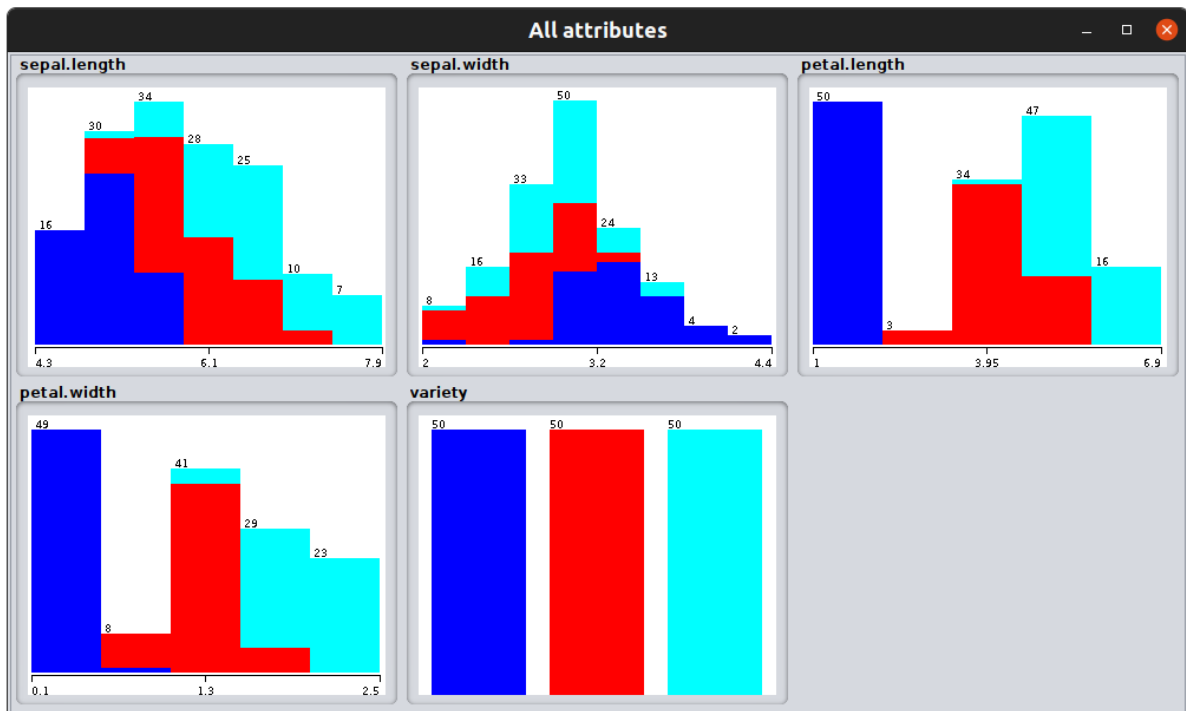

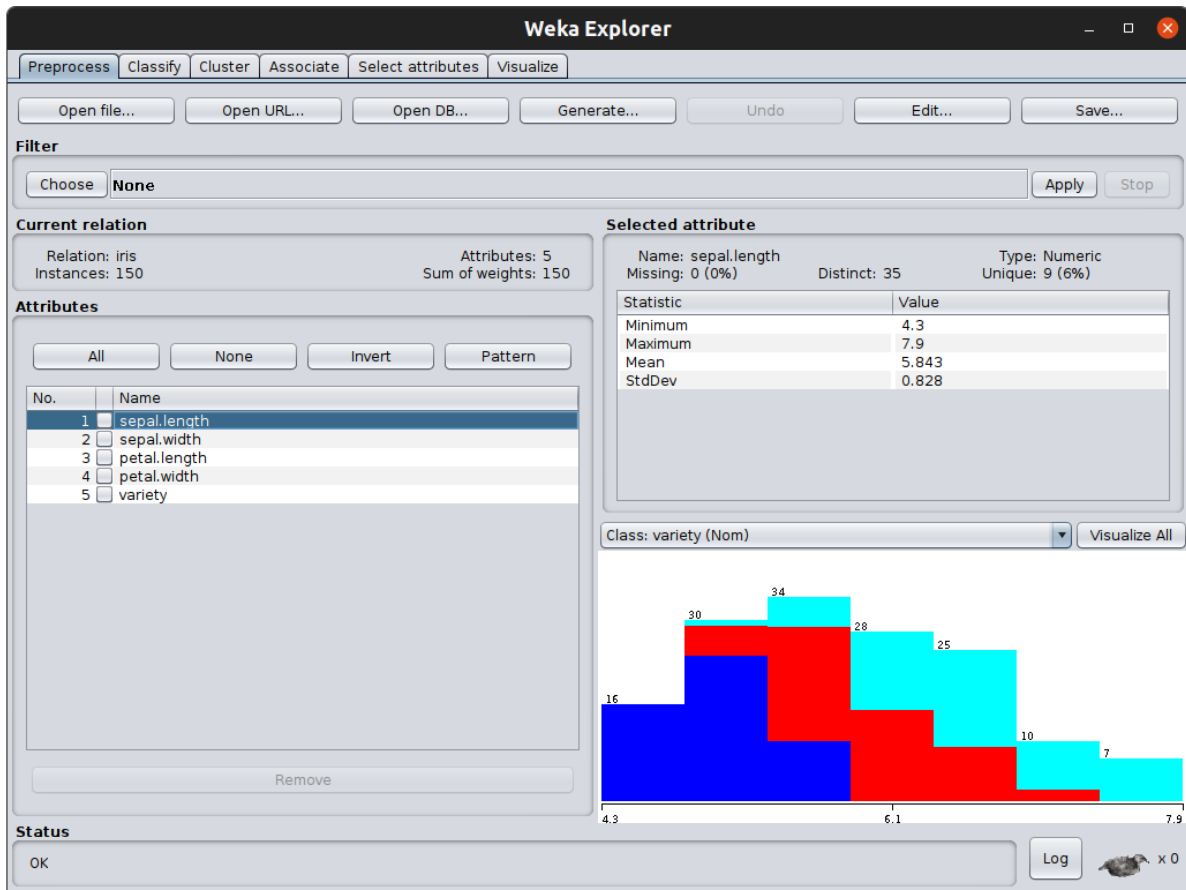

Create a report which will illustrate the details of tasks performed (for e.g to perform preprocessing of data provide details of navigation and selection of appropriate parameters)

Selecting File:

Visualisation:

Classification:

Weka Explorer

Preprocess **Classify** Cluster Associate Select attributes Visualize

Classifier

Choose ZeroR

Test options

☐ Use training set
☐ Supplied test set Set...
☒ Cross-validation Folds 10
☐ Percentage split % 66
 More options...

(Nom) variety

Start Stop

Result list (right-click for options)

17:03:42 - rules.ZeroR

Classifier output

```

=== Run information ===

Scheme:      weka.classifiers.rules.ZeroR
Relation:    iris
Instances:   150
Attributes:  5
    sepal.length
    sepal.width
    petal.length
    petal.width
    variety
Test mode:   10-fold cross-validation

=== Classifier model (full training set) ===

ZeroR predicts class value: Setosa

Time taken to build model: 0 seconds

=== Stratified cross-validation ===
=== Summary ===

Correctly Classified Instances      50      33.3333 %
Incorrectly Classified Instances    100      66.6667 %
Kappa statistic                     0
Mean absolute error                 0.4444
Root mean squared error             0.4714
Relative absolute error             100 %
Root relative squared error         100 %
Total Number of Instances          150

=== Detailed Accuracy By Class ===

```

Status

OK Log x 0

Root relative squared error         100 %
Total Number of Instances          150

=== Detailed Accuracy By Class ===

```

	TP Rate	FP Rate	Precision	Recall	F-Measure	MCC	ROC Area	PRC Area	Class
	1.000	1.000	0.333	1.000	0.500	?	0.500	0.333	Setosa
	0.000	0.000	?	0.000	?	?	0.500	0.333	Versicolor
	0.000	0.000	?	0.000	?	?	0.500	0.333	Virginica
Weighted Avg.	0.333	0.333	?	0.333	?	?	0.500	0.333	

```

=== Confusion Matrix ===
 a  b  c  <-- classified as
50  0  0 | a = Setosa
50  0  0 | b = Versicolor
50  0  0 | c = Virginica

```

Status

OK Log x 0

2. **Orange** is an easy-to-use data visualisation tool with a large toolkit. In spite of being a GUI-based beginner-friendly tool, you mustn't mistake it for a light-weight one. It can do statistical distributions and box plots as well as decision trees, hierarchical clustering and linear projections.

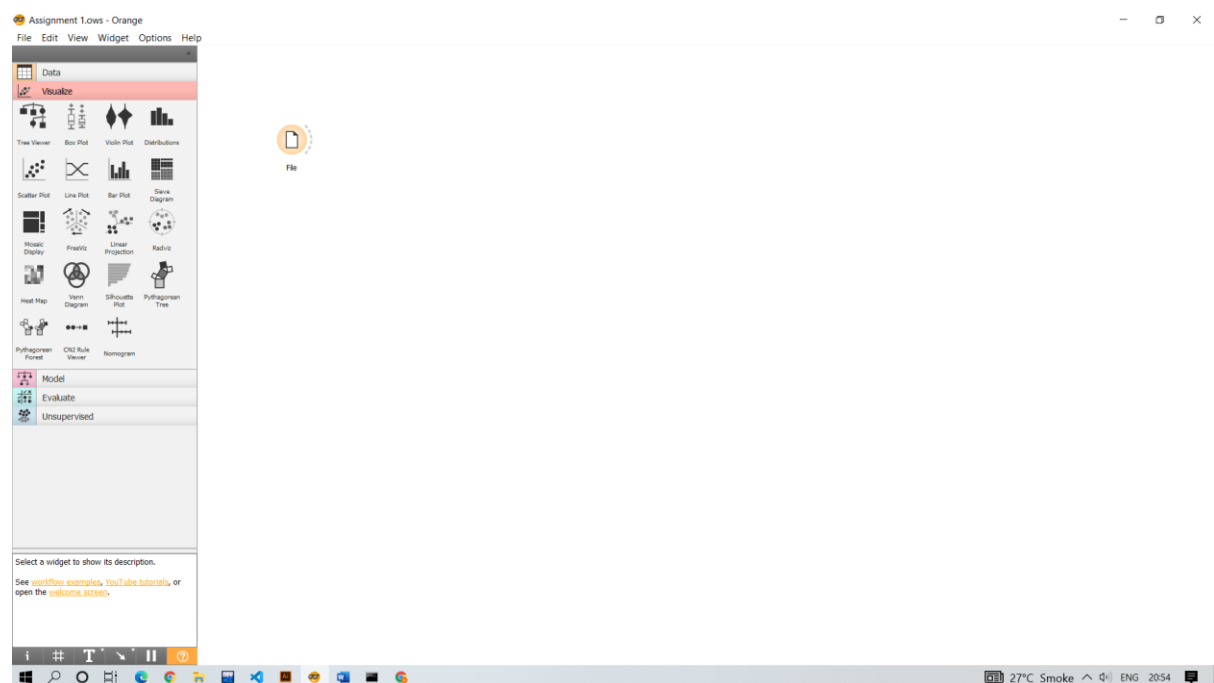

- a. Install orange
- b. Show data distribution
- c. Show linear projection
- d. Show FreeViz

Use dataset

<https://drive.google.com/file/d/1m6sKI1Dap0XK6Bw1edUd5PohwpPwXnd9/view>

Create a report for this task and upload screenshots for the same.

Initial setup and upload data:

data distribution :

Untitled * — Orange

File Edit View Widget Options Help

File Data Distributions

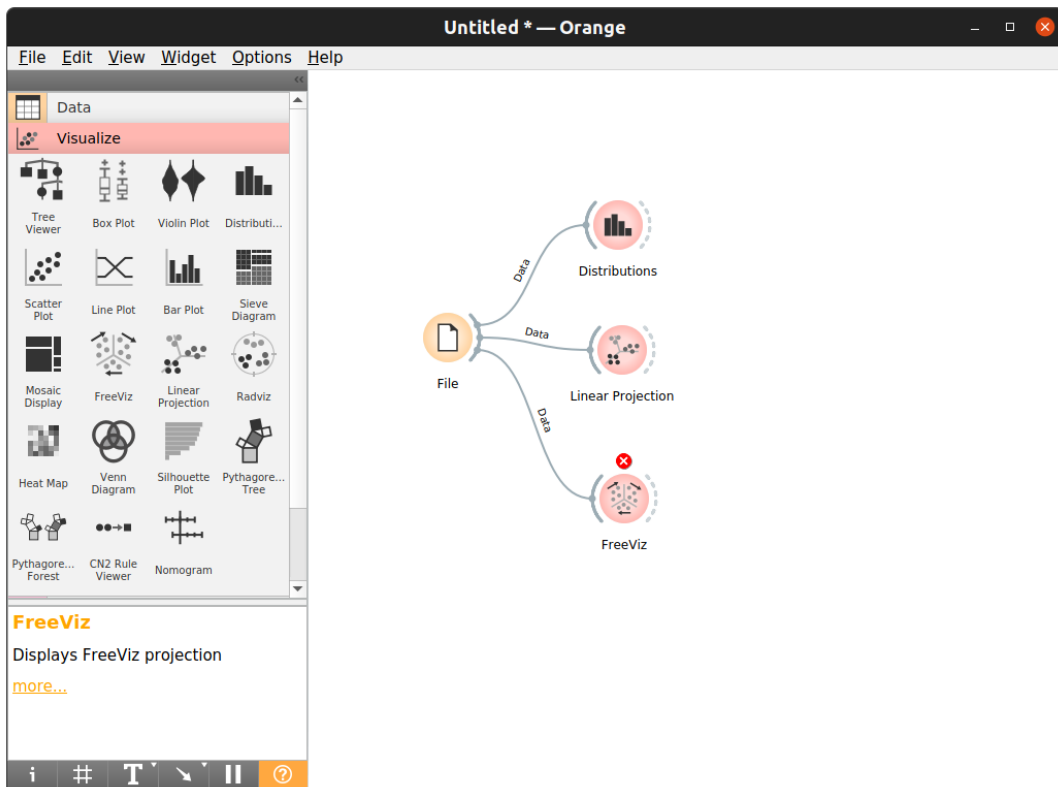

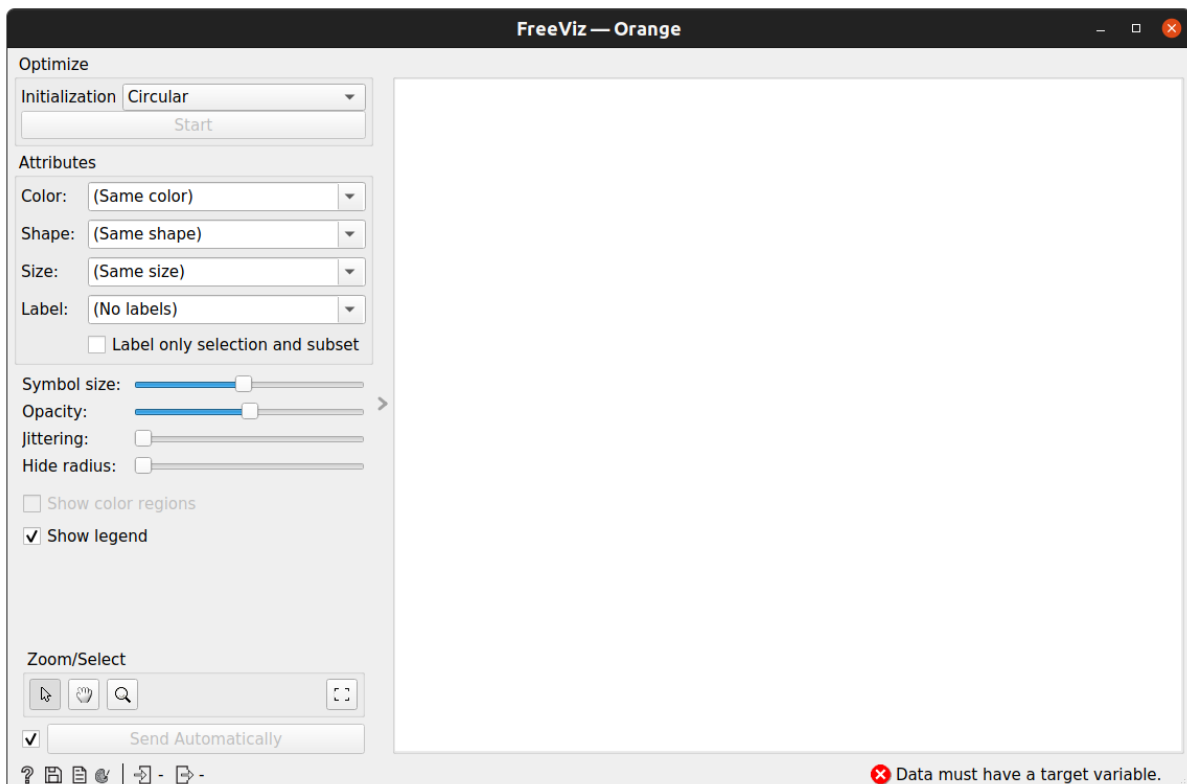

Linear projection:

FreeViz:

(Giving error that, data must have a target)

3. Differentiate in between free software, Open source software and proprietary software with respect to its properties.

1. Free Software:

Free software is a computer software distributed under terms that allows users to run the software for any purpose as well as to study, change and distribute. All users are legally free to do what they want with their copies of free software regardless of how much is paid to develop the program or software

2. Open-Source Software:

Open source software is a computer software whose source code is available openly on internet and programmer can modify it to add new features remove some existing bugs or problems or user might add features that he wants into that existing software without giving any money to developer. This software is managed by an open source community of developers. It provides community support for the software. All users can get this software free of cost. This software also comes with license sometimes, this license might provide some rights to user as:

- No restriction of redistribution
- User is allowed to study or modify code
- Software can be used for any purpose

Examples – Ubuntu, Android, VLC Player, OBS Studio, etc.

3. Proprietary Software:

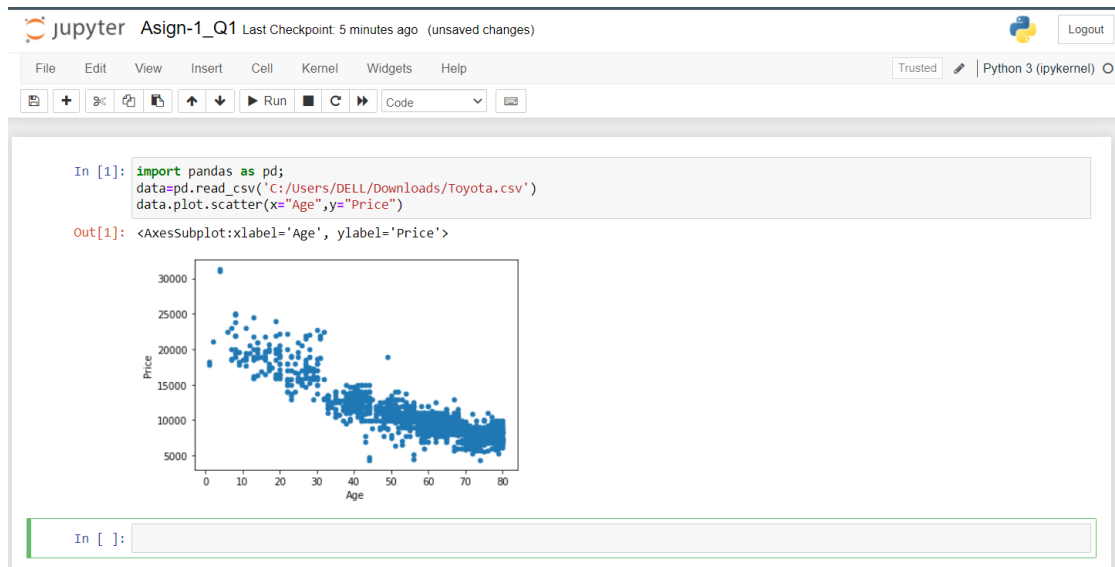

Proprietary software is a computer software where the source codes are not publicly available and the company that has developed the software can only change the code for that software. Generally, this type of software is developed by an individual or some organisations and a team inside the organisation works on that software for its development. If someone wants to use this type of software, he has to pay some money to the organisation to buy a copy of that software. Company gives licence to authenticated users which has some restrictions like:

- Number of installations on different machines.

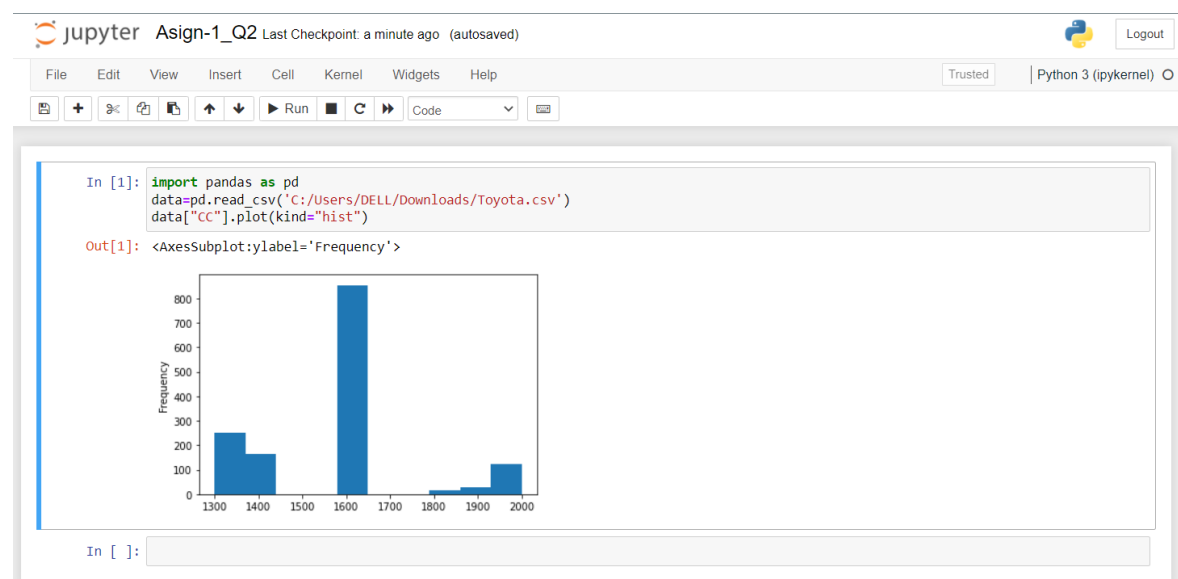

- Time until which software will operate.
- Number of features allowed to use.
- Restriction on sharing the software illegally.

4. Using Python Jupyter, create Histogram, Scatter plot and Bar plot for the dataset given below. Dataset- <https://drive.google.com/file/d/1i11BZFe8Xj9kNq7eeE9KOaIz1KhEdXJ/view>

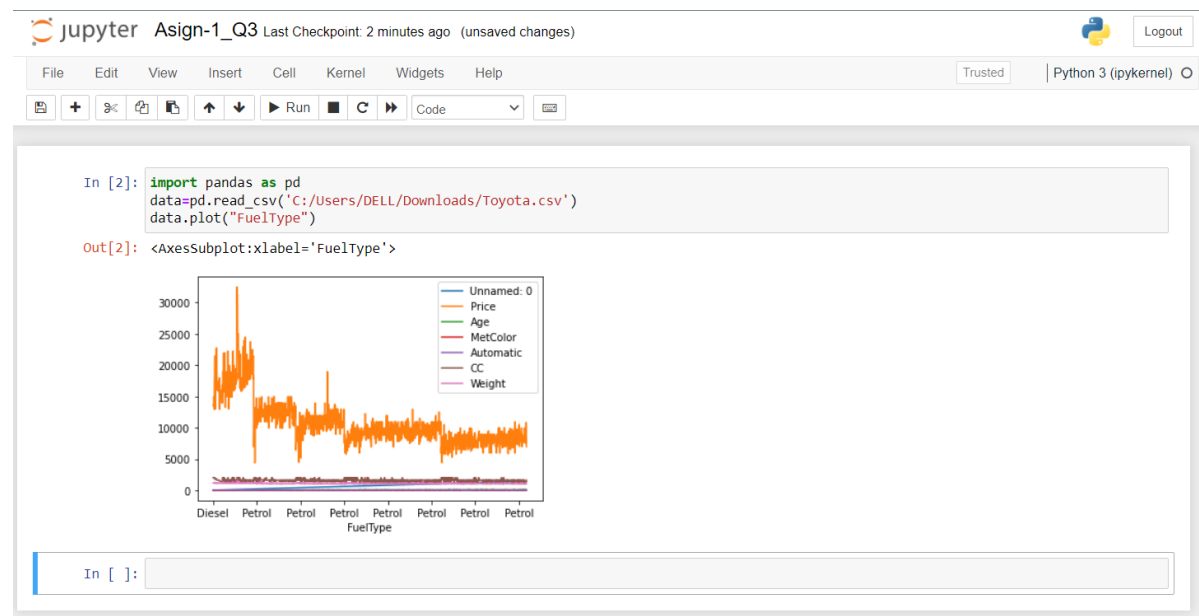

A. Scatter plot- Scatter plot of Price Vs Age

B. Histogram- for Kilometre and CC

C. Bar plot- Bar plot for different fuel types

5. Enlist some examples along with its purpose and properties of FOSS and proprietary software with respect to database

FOSS:

Free and open-source software (FOSS) is a software that can be classified as both free software and open-source software.

Examples: Ubuntu, VLC Player, Android system, etc.

Advantages of FOSS:

1. **Expansive licensing:** Proprietary software licences are usually quite restrictive in terms of use, number of users, type of machine and other. There is a fee to own a licence of a proprietary software. Open-source software is free to own. There is no restriction on how we use the software, we can install it on unlimited machines.
2. **Transparency:** Open-source development is carried out openly. As software code is openly available anyone who finds some bug can fix it for others. As the development process is carried out publicly its development process is transparent. Users can easily communicate with product developers to understand their product decisions and offer opinions for betterment of software.
3. **Source Code inspection:** As source code is openly available anyone can view code of the software for better understanding of how the application works.
4. **Source Code modification:** We can also modify code after inspecting the code. One can modify code and for himself and also, he can add those changes to the main version of software so that changes will be available for everyone to use.
5. **Community:** Foundation of open source projects is community, it includes developers of software and also users. Users in the community can easily share their feedback with developers so that developers can improve the software.
6. **Redistribution rights:** Open-source licences allow users to perform some changes in software and again redistribute the software without taking permission of the original product owner.

Proprietary Software:

This type of software requires licences for their use. Company or organisation that owns the software provides rights to use the software to customers. Users can only install software only on a limited number of machines and cannot redistribute it.

1. Increased Functionality and Convenience

Proprietary systems are easier to use and learn, leading to faster work processes. Skype, for example, is used by organisations worldwide. It takes minutes to sign up for an account and make international phone calls or conduct video interviews online. On top of that, your customers, suppliers and employees may already have a Skype account, so they know how to use it.

Open-source programs are trickier to use and may lack user-friendly features, affecting productivity in the workplace. Unskilled end users may find it difficult to navigate them and take full advantage of what they have to offer. After all, there is a reason so few people use Linux.

2. Superior Customer Support

Open-source software can be difficult to install and set up. Customising it isn't easier either. Plus, your staff may not be familiar with the program and may need additional training.

The average employee lacks the expertise to use open-source programs. Therefore, your team members may need help with most tasks. They will spend hours trying to figure things out instead of focusing on the tasks at hand.

Proprietary software is more accessible and includes technical support. Most companies offering these programs provide dedicated sources, 24/7 assistance, live chat and user manuals. The antivirus program Bitdefender, for example, offers online resources, technical support around the clock and security-configuration services for enterprises. If your

employees experience any issues, they can simply call or email the service provider.

3. Lower Maintenance Costs

As a small-business owner, you may prefer open-source software due to its low cost. Most programs are free or cost next to nothing. The downside is that you may end up paying a lot more for setup, maintenance and customization than you'd pay with proprietary software.

Some open-source programs are difficult to install and set up, so you may need to call an expert to do the job. In some cases, new hardware may be necessary to use the software. If your employees are not familiar with the program, they will need support and training, which may further increase the costs. Updating the software, testing new versions and applying patches isn't cheap either.

4. Stronger Competitive Advantage

Proprietary technology enables organisations to be more profitable, productive and innovative. This is particularly true for software-development companies, which often use custom programs at the core of their business model.

Even if you're not a software developer, you can still benefit from using proprietary systems. For example, you may hire a team to create software programs that integrate with your existing technology. This may improve work performance and productivity in your organisation, streamline business processes and increase production. Furthermore, you may customise the program and add new features as your business changes.

5. Secure Financing for Your Business

Nearly one-third of startups close their doors because they run out of capital. Developing proprietary technology doesn't guarantee success, but it could make it easier to secure financing for your small business. Plus, you will be able to charge higher prices because no other company offers the same product as you do.

As it turns out, big data investors prefer to put their money in companies selling proprietary software — or at least something other than open-source software, such as proprietary add-ons. This kind of technology isn't restricted by what already exists in the market.
